

Assessment Declaration — Condition 3: Bounded Use of Generative Artificial Intelligence

Student name	Heet Chanchad	Student number	s4218211
Course	Case Studies in Data Science	Course code	COSC2669 / COSC2816
Assessment	Individual Task 1: Part 1	Date	14 August 2026

Declaration of use

I declare that generative AI was used in the preparation of this assessment, within the bounds permitted under Condition 3, and that its use is disclosed in full below. The tool used was **Claude (Anthropic)**. No other generative AI tool was used. I take full responsibility for the content of the submitted work, including any material that originated as AI output.

Where and how it was used

Where in the assessment	How generative AI was used	How I verified, corrected or took ownership of the output
Part 1.1 — role and job advertisement	Used to search for live machine learning engineer advertisements and to confirm the listing URL resolved and the role was still open.	I selected the role myself and read the full advertisement. I confirmed the closing date and the live application link directly on the employer's job board, and quoted the responsibilities verbatim from the source rather than from any summary.
Part 1.1 — written responses	Used to draft and then condense prose to fit the 50-word limits on the industry, role focus, value, values and diversity questions.	The argument in each response is mine. I checked every claim against the advertisement text, verified each word count, and rewrote wording that did not reflect my own position, particularly in the values response.
Appendix — cover letter	Used to draft the letter and structure it as a stand-alone document.	All personal details, my degree, my graduation date and my stated motivation are my own and were checked for accuracy. I removed a claim about meeting the employer's onboarding window once I confirmed my graduation date does not fall inside it.
Part 1.2 — datasets	Used to identify candidate public datasets and to test whether their download URLs were reachable without an account.	I chose the final two datasets. The sizes, attribute lists and class balances quoted in Table 1 were produced by running <code>02_profile_data.py</code> over the downloaded files, not taken from any description.
Part 1.3 — analysis code	Used to draft the Python pipeline: dataset download, profiling, the cross-validation harness, the paired t-test, the cross-corpus transfer test and the figures.	I ran the code myself and every number in Section 3 comes from that execution, not from the model. I reviewed the harness specifically to confirm the vectoriser is fitted inside each fold, since fitting it over the whole corpus would have leaked test data and inflated every result.
Part 1.3 — interpretation	Used to draft the written discussion of the results.	The interpretation is mine, including the decision to treat the two data sources as complementary about model choice but contradictory about labels, and the recommendation to ship the simpler model. I corrected drafted text that overstated the significance of the paired t-test.
Document production	Used to format the LaTeX sources, assemble the BibTeX entries in ACM style, and typeset the retrieved job advertisement for the appendix.	I compiled the document and inspected every page. Doing so revealed that the job advertisement figure was omitting its second page and that the cover letter was breaking across two pages; both are recorded in Appendix B and were fixed.

What generative AI was *not* used for

It was not used to generate any result, metric, table value or figure reported in Section 3. Every quantitative claim in this report was produced by executing the code in the linked repository. It was not used to fabricate or alter data, and it was not used to write this declaration's account of my own verification steps.

Student statement

I confirm that this disclosure is complete and accurate, that I understand the work submitted is my responsibility regardless of how it was drafted, and that I am able to explain and defend any part of the submitted analysis, code or written argument if asked to do so.

Signed

Heet Chanchad
